/browse_refresh

Refresh the @ file-picker project index

Overview

`/browse_refresh` rebuilds the in-memory project-file index that the `@` file picker uses for autocomplete suggestions. Use it when files have been created, renamed, or deleted outside ragent and the picker is showing a stale list. The cache is also refreshed automatically in the background, so this command is only needed for an immediate refresh.

Syntax

```
/browse_refresh
```

The command takes no arguments. Extra tokens are ignored.

Options / Subcommands

Form	Description
`/browse_refresh`	Re-collect the project file cache (up to 10,000 entries) and refresh the picker menu

Examples

Refresh the index after creating new files:

```
/browse_refresh
```

Status bar shows: `browse index refreshed (1234)` where the number is the cached entry count.

Output

- The status line reports `browse index refreshed (N)` with the number of cached project files.
- An info log entry records `@ picker index refreshed (N entries)` in the log panel.
- The next time the `@` file picker opens, it lists the refreshed set of project files.

Related
