

Tool Visibility

ragent can hide or expose whole tool families through persistent visibility switches. This keeps the model's advertised tool list focused without removing the tools from the binary.

Switches

The available switches are:

Switch	Default	Family
office	off	Office/PDF tools
github	off	GitHub issue and PR tools
gitlab	off	GitLab issue, MR, pipeline, and job tools
teams	off	Team coordination tools
agents	off	Autonomous agent task tools
plan	off	Plan-mode tools
codeindex	on	Code index tools
masterfetch	on	MasterFetch web-access tools (mf_fetch, mf_search, mf_crawl, mf_screenshot, mf_cache_clear, mf_version)
browser	on	Browser automation tool (browser — Chrome DevTools Protocol)
finance	on	Finance/stock/currency tools (stock_quote, stock_history, stock_fundamentals, stock_search, stock_options, stock_recommendations, currency_rate, currency_history)

When a switch is off, tools in that family are excluded from:

1. The tool list advertised in the system prompt
2. The tool schema list sent to the provider

The tools remain registered, but the model is not told to use them.

Slash commands

Use /tools from the TUI:

```
/tools
/tools help
```

```
/tools <switch>
/tools <switch> on
/tools <switch> off
```

Examples:

```
/tools github on
/tools office on
/tools teams off
/tools agents off
/tools plan off
/tools codeindex off
/tools masterfetch off
/tools browser off
/tools finance off
```

Changes are written to `.ragent/ragent.json` when a project config directory is present, or to the user config otherwise.

Config file

You can also configure visibility directly in `ragent.json`:

```
{
  "tool_visibility": {
    "office": true,
    "github": false,
    "gitlab": false,
    "teams": false,
    "agents": false,
    "plan": false,
    "codeindex": true,
    "masterfetch": true,
    "browser": true,
    "finance": true
  }
}
```

Interaction with hidden_tools

`hidden_tools` is still supported. It remains additive:

- `tool_visibility` hides whole families
- `hidden_tools` hides specific tool names

If either mechanism hides a tool, that tool stays out of the advertised tool set.

Code index compatibility

`/codeindex on` and `/codeindex off` also keep `tool_visibility.codeindex` in sync, so the code index command and the tool visibility command do not drift.

Finance visibility note

The `finance` switch was added in v1.0.45. It controls the visibility of all `stock_*` and `currency_*` tools. When set to `off`, the tools are hidden from the model's advertised tool list but remain registered and callable. The finance tools are visible by default (`on`). Note that the `/tools` TUI command does not currently include `finance` in its interactive switch list, but the switch can be set via `ragent.json` as shown above.
