/about

Show application info, version, and authors

Overview

`/about` prints a short informational banner describing ragent: what it is, the compiled version number (`CARGO_PKG_VERSION`), the build timestamp, the source repository URL, the license, and the author list. It takes no arguments and performs no configuration lookups - everything shown is baked in at compile time except the build date, which is stamped when the command runs.

The output is appended to the message window as an assistant bubble prefixed with `From: /about`, and the status bar is set to `about`.

Syntax

```
/about
```

Options / Subcommands

Form	Description
`/about`	Show the application info banner

No subcommands or arguments are supported; extra text after the trigger is ignored.

Examples

```
/about
```

Display the banner:

```
ragent - AI Coding Agent

An interactive TUI-based AI coding agent
supporting multiple LLM providers.

Version:     1.0.95
Built:       2026-09-11 08:14:02 UTC
Repository:  https://github.com/thawkins/ragent
License:     MIT

Authors:
  Tim Hawkins <tim.thawkins@gmail.com>
```

Output

- An assistant message bubble titled `From: /about` containing the info block.
- The version line comes from the crate version compiled into the binary.

- The `Built:` line reflects the wall-clock time the command was run (UTC), not a compile-time build date.
- Status bar shows `about`.
