/clear

Clear message history for the current session

Overview

`/clear` wipes the in-memory message history for the current session: the message list, the rendered-line cache, the tool step-numbering maps, and the scroll position are all reset, and the shared prompt-context cache is cleared so the next turn is rebuilt from scratch. The session itself is not deleted - stored history on disk is untouched; only what the TUI displays is reset.

The status bar confirms with `messages cleared` and an Info log entry records the action.

Syntax

```
/clear
```

Options / Subcommands

Form	Description
`/clear`	Clear the message window history for the current session

No arguments or subcommands; any extra text is ignored.

Examples

```
/clear
```

After running, the message window is empty and the status bar shows:

```
messages cleared
```

Output

- The message window is emptied immediately (messages, line cache, scroll offset, and tool-step counters reset).
- The prompt-context cache is invalidated.
- Status bar shows `messages cleared`; an Info log entry `Message history cleared` is written.
- The session record and its persisted history are not affected.

Notes

- `/clear` operates only on the TUI display layer. Sessions stored in SQLite keep their full transcript; resuming the session restores what was stored.
- Tool step numbering (the `1.`, `2.` step numbers shown next to tool calls) restarts from scratch after a clear, since the per-session step counters are reset along with the messages.
- The prompt-context cache shared with the agent layer is invalidated, so the next prompt is assembled without reference to the cleared messages.

Related

- `/compact` - summarise long history into a compact form instead of clearing
- `/history` - browse previous inputs and re-insert one
- `/session` - manage stored sessions (list, resume, export)
