Tools — Skills

Loadable skill packs (bundled or custom YAML / `SKILL.md`) that inject tools, prompts, and file context into agent sessions.

Tool	Description
`Skill`	List, read, load, or reload skill packs.

Tool restrictions (`allowed-tools`)

A `SKILL.md` frontmatter block may limit the tools the run can call:

```yaml
---
name: rename-check
description: Check the rename landed
allowed-tools:
  - Bash
  - read
  - Grep
  - Glob
---
```

Resolution is a **case-insensitive name comparison** against the registry. The entry is stored under the registry's own spelling, so two spellings of one tool cannot become two keys in the allowed set. There is no translation layer, so:

- the thirteen Claude Code spellings the rename adopted resolve as written - `AskUserQuestion`, `Bash`, `Edit`, `EnterPlanMode`, `ExitPlanMode`, `Glob`, `Grep`, `Skill`, `TaskCreate`, `TaskGet`, `TaskList`, `TaskUpdate`, `Write`;
- the tools the rename did **not** touch keep their ragent spelling - `read`, `list`, `think`, `codeindex_search`, and so on;
- **case does not matter**: `Bash`, `bash` and `BASH` all name the registry's `Bash`, and `grep` names `Grep`, so a manifest can use whatever case reads best (the registry's spelling is what the restriction then holds);
- a retired spelling that names a **different** tool (`task_create` for `TaskCreate`, `Read` for `read`) still matches nothing. Case folding resolves one tool; it never resolves a different one;
- `any` (in any case) is a pseudo entry that names every tool: the restriction is lifted, exactly as if the list were omitted. It is never reported as unresolved because it names a policy rather than a tool, so it does not depend on a registered tool of that name existing;
- an empty list means "no restriction", not "no tools".

An entry that matches no registered tool would silently remove a capability, so it is reported once per `(entry, skill)` pair - naming the entry and the skill - at the moment the skill's list becomes the restriction (`Skill`, `/skill <name>` / `/<name>`, and the forked-skill resolver). Fix the manifest; the run continues with the entries that did resolve.

YAML reads a bare comma list as one scalar: `allowed-tools: Bash, ReadFile` is a single entry named `Bash, ReadFile`. Use the block form above.

Skill

Manage the skill registry at runtime.

Arguments

Argument	Type	Required	Description	Typical value
`action`	enum	yes	`list`, `read`, `load`, `reload`	`"list"`
`name`	string	yes for `read`/`load`	Skill name	`"code-audit"`
`arguments`	string	no	Substituted into the skill body (`$ARGUMENTS` and friends) for `read`/`load`	`"crates/ragent-server"`
`scope`	enum	no	`list` filter: `bundled`, `enterprise`, `openskills-global`, `personal`, `openskills-project`, `project`	`"project"`
`include_bodies`	boolean	no	`list` includes full prompt bodies (default false: metadata only)	`false`

Example:

```
Skill action="list"
Skill action="load" name="code-audit" arguments="crates/ragent-server"
```
